

COVER LETTER

Dear Hiring Team,

Data pipelines are the part of my work I keep coming back to — the moment a slow query turns fast, or raw data becomes something a business can actually trust, is what pulled me toward Data Engineering as a genuine career direction rather than just a skill on a resume. My background is in enterprise software development, where I built a strong foundation in SQL and structured problem-solving, but it was writing and optimizing data pipelines that consistently felt like the most interesting part of the job.

One example: I identified a SQL-based transformation processing over a million rows that was taking 50 minutes to run. I rewrote the logic in PySpark, cutting runtime to 13 minutes, roughly 74 percent faster, which meaningfully improved downstream reporting turnaround. Alongside my day-to-day work, where I configure Databricks clusters, schedule jobs through Databricks Workflows, and read and write data to and from AWS S3, I have also built an independent end-to-end ETL pipeline using Medallion architecture, Delta Lake, and a 53-check automated data quality framework, which pushed me to think seriously about pipeline reliability rather than just getting data from one place to another.

I hold the Databricks Certified Data Engineer Associate certification, and I continue to build hands-on depth deliberately rather than passively. I am looking for a Data Engineer role where I can bring this combination of practical SQL and pipeline experience, a habit of digging into performance problems until I understand them, and a genuine interest in building reliable data systems. I would welcome the opportunity to contribute and grow with your team.

Yours Faithfully
